- Ultracentrifuges were developed by Dr. Steenbeck at Department 3, the mechanical department, of the nuclear institute in Sinop. In addition to his nominal deputy Dr. Trattner (fnu), Steenbeck had Dr. Steudel (fnu) as a practical deputy. The latter controlled the development of the ultracentrifuge which he continued after Kaiblinger left in 1947. Prior to 1947, two development stages were apparent. These were based on mechanical metallurgical problems with the rpm figures being the essential development problem.
- ?. During Stage A of the development, Kaiblinger was ordered to construct the motor unit of several cover layers of metal foil strips. On a lathe he wound the foils at a planting engle to the axle of retation around a core which was to be removed afterwards. During winding process, the layers were also soldered. The finished winding was 0.2 mm thick. The lids were also produced as foil packages under pressure and were provided with canulas soldered into the Rid. All rotor units, even if the thickness of their walls veried, had an external diameter of 50 mm and a length of 400 mm. The first rotor units constructed were driven by means of specially constructed jears powered by standard engines operating at about 5,000 rpm. The maximum speed obtained was 80,000 rpm which was about the limit the gears could stard Since the heat produced by the rom rating was too high, the following listed foil materials were tried in succession: copper, brass, nickel, aluminum, chromium, silver, gold and others. 100,000 rpm turned out to be the critical speed. The development program, therefore, requested 150,000 rpm portly in order to overcome the critical figure and also to obtain a figure high enough to effect isotope separation. Since these figures were not obtained with the foil rotors, an entirely different system was adopted for the production of rotor units. I-A-I-I-D-D-D-R-I-I-A-I

3. Stare B. Dr. Ziegler (fnu) developed a special aluminum alloy, the formula of which was unknown. Kaiblinger was given an injot of this material from which he turned the new rotor, 400 mm long-50 mm external diameter and 47 mm internal diameter and subsequently 1.5 mm thick. The blank was then machined in a cold process by a specially manufactured tube rolling mill and finally reinforced. The apertures were provided with screw lids into which standard canula needles with a external diameter of 2.5 mm and an enforced upper part were inserted. The internal walls of the rotor were lined with permanent magnets. In long lasting processes, Maiblinger gradually eliminated all unbalances of the rotor using machinery and instruments of the precision mechanical workshop of Ingenieur Klein (Inu). The construction was delayed by the time-consuming production of needle bearings by Kaiblinger. Sleeve bearings were fitted at three places of each of the two capillary tubes-type canules. The end of a canula was bedded against the front part and the side of the tube and the stronger and against the front. Thite metal was used as bearing material. The entire bearing system was cooled by chambers of liquid air. The rotor was driven asynchronously by a high frequency transmitted via a continuous winding wrapped around the rotor chamber and me longer by a synchronous motor. Two improved nodels were constructed with a primary rpm rating of 115,000 which was increased to 130,000 rpm and finally reached 150,000 rpm without any defects.

In addition to the original design of the ultracentrifuge which included a simple hollow rotor unit with one upper and one lower capillary tube, other models were designed with additional lead-ins which were specially heat insulated under glass. Thermal control equipment for the thermodiffusion of the gas stream within the centrifuge was also installed. The final result however was obtained only by

an improved cooling system involving air and water.

5. In 1947, the results obtained in the diffusion of UF6 were 2 percent. Kaiblinger had frequently discussed this figure with Dr. Steudel but was not quite ours whether the latter had given this figure or not. Steudel also repeatedly mentioned during these conversations that it could not actually be expected that the centrifuge system would ever be applied on an industrial level.

Comment. For a table of organization and list of personnel employed at the nuclear insultute of Lanfred von Ardenne in Sinop, status 1946/1947, see Annex.

Table of Organization and List of Personnel of the Muclear Institute in Sinop

-3-

The Simop institute included three departments. Manfred von Ardenne was chief of the entire institute and also of Department 1.

Department 1: Department of Electro Physics Manfred von Ardenne

Department 2: Department of Chemistry Professor Thiessen (fnu)

Department 3: Mechanical Department Professor Steenbeck (fnu)

These three departments included the following personnel:

chisf of the electric workshop Department 1 Ernst Richard Apitsch

general administration (dergengruen was Alexander Bergengruen

Ardenno's father-in-law)

Erwin Alfred Becker glass blower, Department 3. Becker also

constructed the glass temperature caps for the switching unit of the centrifuges.

chemise, Department 2 Dr. Karl Bernhard

chemist, Department 2 Dr. Ernst Busse

Dr. Delvendahl (fnu) meteorologist and mathematician

August Deutsch mechanical engineer, Department 3,

constructed a circular spinning frame for laboratory material at Sinop. He is

allegedly in Ilinskaya at the present time

blacksmith, Department 3 Hurt Fliegner

Custar Fliegner, A.Fliegner's electrician, Department 1

Laboratory assistant of Dr. Steenbeck, Hermann-Fritz Florek

Department 3

engineer, Department 1 in "Nouse \mathbb{R}^n Heinz Ernst Freehlich

working in the field of magnets

physicist, Department 1 Dr. Guenter Fuchs

25X1

-4-

Heinz Gaedicke (from Duesseldczf)

chief mechanic, Department 2, constructed with assistants all chemical testing equipment for Professor Phiessen

Hermann Geri (from Freiburg/Breisgau) electrician for Apitzsch, Department i

erner Goldbach

laboratory assistant, Department 3, working for a Soviet Professor of Steenbeck's group

Helmus Hepp

graduate engineer, physicist, Department !

Aurt Heppner

chemist, laboratory assistant, Department 2

Gerhard Hoenow

laboratory assistant, Department ?

Ferdinand Kafks

engineer, Department 1

Siegfried Klein

precision mechanic working in an independent department equipped with a complete workshop

brought from Berlin

Hargot Koerber

assistant, Department 2

Kretzig (fnu)

designing office, Department 2

Krueger (fnu)

chief electro mechanic, Departments I and 3. Among other equipment he constructed electric measuring instruments for the development of the centrifuges. How were measures

electrically.

Gerda Langsdorf

at first second secretary of Ardenne, Later

institute librarian

Emil Lorenz

glass blower, constructed glass caps for the lead-ins to the centrifuges

hauler (fnu)

material supply and administration

Wladimir Maydel

graduate engineer, physicist. Department 1

Fritz Mainhardt

mechanic in Sille's group

Dr Kurt Meloun

physicist, Department 1

Dr Moerhard Melchior

mathematician, now in Ilinskaya

Dr Gotthard Mueller

high frequency physicist, Department 1. Constructed mains for the mass spectrographs and was allegedly involved in research actitities of his own. Morked previously at the Lorenz Firm in East-Berlin.

or Gerd Praetorius

expert in high voltage, Department 1 and also expert for electron photography

and droo onpore r

Dr Herberg Reibedenz

physicist, Department 1

Hans Artur Richter

precision mechanic of Klein's group

Dr med Kurt Rintelen

laboratory assistant, Department ?

Hans Fritz Schlesing

laboratory assistant, Department 3

Hermann Schmahl

engineer, Department 1

Horst Schroeder

laboratory assistant, Department 2

Schrottke (sen) (fnu)

laboratory assistant, Department 1

Mrs Schrottke (fnu)

second secretary of Ardenne

Schulze (fnu)

mechanic in Sille's group

Karl Heinz Sille

engineer, had his own group for the

installation and technical centrol of

all workshops

Walter Sommerfelds

engineer, Department 1

Wolfgang Socke

precision mechanic in Klein's group

Dr Eberhard Steudel

working under Steenbeck's control as manager of all departments of physics, among other activities on the construction

of the centrifuges

liss Striepling

laboratory assistant, Department 2

Else Suchland

first secretary of Ardenne

Erwin Suckow

engineer, Department 1 in "douse D", working in the field of magnets, was repatriated

to Meddersheim near Sobernheim

Dr Robert Trattner, Austrian

formal deputy of Stoenbeck, Department 3

Custav Treff

mechanic, Department 3

Ludwig etzlar

electro mechanic, Department 3, his work included the winding of the centrifuges

Legend.

. 7 %

Diagrams of the Ultracentrifuge, scale 1 to 2 and 2 to 1

- A Cross section, scale 1 to 2
- B Longitudinal section, scale 1 to 2
- C Lower needle bearing, scale 2 to 1
- 1 Rotor unit, external diameter 50 mm internal diameter 47 mm walls 1.5 mm thick length 400 mm

For the preliminary experiments the unit was manufactured of wound metal foils with walls 0.2 mm thick

- 2 Screwed in lid
- 2 Needle canula, external diameter 2.5 mm
- 4 Socket for needle bearing
- 5 Permanent magnets, steel plates
- 6 Continuous field winding around outer coat
- 7 Inforced canula over the bedding
- 8 Searing material

Operational procedure:

The rotor tube functioned as motor armature. The continuous field winding around the outer coat was fed by a high frequency transmittor. No additional information was obtained. Lead-in and discharge was effected through the canulae. In addition to the product of inertia, thermal diffusion was to be effected.
